

Nick Vermeylen

Team Captain Java Fullstack

Gent, Belgium
25/09/1995

I am a highly energetic and passionate **Fullstack Developer**, dedicated to delivering clean, maintainable, and scalable solutions. I thrive on immersing myself in new business contexts and domains, translating this understanding into software that delivers real value. With a preference for being involved throughout the entire development lifecycle, I bring hands-on expertise from recent projects at DPG Media and Brussels Airport, where I focused on **Cloud Native applications** on **AWS** using **Microservices and Serverless architectures**.

In addition to my consulting work, I serve as Team Captain for the Axxes Java Fullstack Team, mentoring consultants in both technical excellence and personal growth.

Skills

Java	4	Spring Boot	4
TDD	4	Python	3
Kotlin	2	DDD	3
React	3	TypeScript	2
AWS	3	MongoDB	3
Docker	3	Git	4
RabbitMQ	2	Kafka	2
CI/CD	3	Terraform	3
Cloudformation	2	Scrum	4
Microservices	4	Serverless Architecture	3
AI coding assistants	3	E2E testing	2

Projects

Axxes

Interim League Lead

01/2026 - 06/2026

Assumed the interim League Lead role for the Java League at Axxes, stepping into a position that combined engineering leadership with HR responsibilities. Managed the full employee lifecycle, from onboarding to performance management, while actively contributing to the league's strategic vision and direction.

Worked closely with consultants to support their day-to-day needs and long-term growth, acting as a key point of contact between the team and the organisation. This role served as a natural extension of my Team Captain responsibilities, allowing me to further sharpen my coaching, mentoring, and people management skills in a broader leadership context.

Tasks

- Managed the employee lifecycle across the Java League
- Shaped and communicated the league's vision and strategic direction
- Supported consultants in their personal and professional growth
- Acted as the primary HR point of contact for the league

Skills

Coaching | HR | People & Performance Management

DPG Media

Fullstack Developer

01/2024 - 02/2026

DPG Media is one of the largest media organizations in the Benelux region. It operates a wide range of popular newspapers, magazines, television channels, and digital platforms. Known for its focus on high-quality journalism, entertainment, and advertising, DPG Media's brands include Het Laatste Nieuws, de Volkskrant, VTM, and Qmusic, among others.

I worked in the IO Crowd team within the Editorial Area as Fullstack Developer. Our team handled everything "print" related in the area. This mostly meant building custom integrations with 3rd party software like Woodwing, Adobe CC applications or other systems.

We used various cloud patterns to house all the different integrations and custom use-cases. The print platform consists of EC2 for InDesign renderers, Fargate for WoodWing containers and React Microfrontends, Lambda functions for backend & integration, Observability Platform (Grafana stack), SNS/SQS for async communication, API Gateway for synchronous and WebSocket communication and Step Functions (business process modeling) for the more complex scenarios allowing far better resiliency.

Besides maintaining and creating new integrations using Python on AWS Lambda, one of my other main responsibilities was creating new microfrontends using React and Typescript. These microfrontends of widgets would replace existing deprecated components in the custom content management system used by editors.

Tasks

- Extended the serverless backends using AWS Lambda, Python, DynamoDB and API Gateway
- Built 3rd party integrations using sync and async patterns with both internal and external systems
- Built 2 Microfrontends in React
- Re-architected Image preflight and tuning integration
- Contributed to the "Frontend Guild" to align cross-team and area

Skills

Python AWS Lambda AWS ECS Cloudformation Serverless Architecture Terraform AWS Step Functions Typescript React Microfrontends Playwright DynamoDB RDS Microservices Pair Programming Mob programming TDD DDD

Brussels Airport Company

Fullstack Developer

05/2022 - 01/2024

Brussels Airport Company is the operator of Brussels Airport, the main international airport of Belgium, located in Zaventem. The company is responsible for the management, development, and maintenance of the airport's infrastructure and services, serving millions of passengers and cargo operations each year. Brussels Airport Company focuses on efficiency, sustainability, and customer service to maintain its status as a key European aviation hub.

At Brussels Airport Company, or BAC for short, I was part of a "teaming project". This meant our entire team of engineers was exclusively staffed by Axxes.

Our squad was responsible for all engineering pertaining to the airport's effort to improve their AOP (Airport Operations Plan) systems. In a nutshell, the AOP project attempts to improve efficiency of all processes of the airport. From Passenger Experience to Baggage Handling to Aircraft Processes. All these processes were mapped and visualized on the platform. The project in a first phase tries to visualize all these processes and highlight delays, issues or inefficiencies using all available data streams. In the next phase mitigating actions are either suggested or automatically applied.

From an application view the "platform" consists of three big applications:

- HELI - provides high level overview of all processes and highlights issues or delays - monitoring airport operations
- SIBIL - provides forecasts on most of these processes. For example: How many passengers will pass through security at a certain point in time, etc.
- Data Warehouse - all things post-ops - no involvement

Tasks

- Deliver phase 2 implementations on the Heli and Sibil Vue applications (real-time bag monitoring, screening "digital twin", improved forecasting and monitoring graphs, ...)
- Rework BFF pattern used for Frontend application views
- Extend Backend Data platform that consumed all relevant data streams for real-time monitoring and forecasting in Java, Spring Boot, Kafka
- Coaching and Mentoring using Pair and Mob programming
- Hotfixing and incident management in on-call rotation

Skills

Spring Boot | Java | Kafka | Kafka Connect | Kubernetes | AWS | MongoDB | Terraform | Vue | JavaScript/TypeScript | DynamoDB | Pair Programming | Mob programming | TDD | DDD | PostgreSQL

Conundra

Fullstack Java Developer

09/2020 - 05/2022

Conundra offers an ecosystem of applications for logistical operations. They help their customers plan their deliveries more efficiently and automate a pretty manual process in the logistical sector.

I was part of the team that was responsible for a few of their core applications. First of all there was Match, which allows users to manage orders, vehicles and the planning and optimization of routes. This application is an AngularJs / React hybrid frontend application supported by a Java Spring Boot backend and a separate application solely responsible for the optimization of routes. Secondly we maintained their core authentication application which was used to provide a SSO experience across the ecosystem and also exposed a Usermanagement solution for internal use. Lastly we maintained various customer specific solutions, these projects only needed updates and small infrastructure related tasks.

Besides development we were also responsible for all operational aspects of these applications (and some other team 's applications). All our infrastructure was hosted in the AWS cloud. We mostly managed everything using IaC (both Cloudformation and Terraform were used).

Our final responsibility was improving operational security and resiliance as part of the company's ISO 27K Certification. These tasks varied but the general idea was: making sure all data was stored securely, all servers were patched automatically, writing and updating disaster recovery scenarios, etc.

Besides implementing actual features, at Conundra we were E2E responsible for creating solutions to our customer's questions and problems. This not only meant implementing these solutions, but also designing, adjusting, and testing them in the best way we could. I loved this approach because I had an impact on the entire software development flow.

Tasks

- AWS Cloud infrastructure management and implementation
- Operational Security as part of ISO2700 certification
- 2nd line support - You build it, you run it principle
- Full-stack feature development for their planning and optimization tool.

Skills

Spring Boot | Java | AWS | Angular | Terraform | MongoDB | JavaScript/TypeScript | CircleCI | TDD

Liantis

Fullstack Java Developer

05/2018 - 09/2020

Liantis is an HR and entrepreneurship service provider that assists freelancers, business owners, and employers with administrative processes, payroll, social security, and workplace wellbeing.

I joined a pre-existing scrum team of 5 developers and both an analyst and a project-owner. Our project focus shifted multiple times within this time period of 2+ years, but our main focus consisted of application development to improve upon both internal as external (customer) processes e.g. Integrations with partners, designing and developing digital solutions for internal manual of semi-digital processes, developing solutions for customer-facing flows such as “starting a business” , “being self-employed”, etc ..

Team Focus: ·

- Fullstack development of several integration projects between internal software applications.
- Development of new Internal software applications. Based on existing microservice architecture. Design and implementation of both front- and backend.
- Development of new customer facing applications and portals with a focus on customer experience. Mostly designing and implementing suitable solutions for backend processes and clean and precise implementation of frontend designs.

The entire architecture consisted out of small, independent and domain appropriate microservices communicating with each other through REST, SOAP and ActiveMq & RabbitMQ Queues . Each frontend application had their own gateway being a microservice on its own connected with the other services needed to provide the frontend with the correct information.

Tasks

- Guiding of and contributing to internal learning and development.
- Giving sprint demos to stakeholders and other development teams
- Investigating new technologies, developing POCs, managing Technical Debt.
- Release follow-up and testing during monthly release windows.
- Building towards CD (continuous deployment) by doing some of our own releases using Jenkins Pipelines
- Debugging, restarting and health management on DTAP environments (servers)

Skills

Spring Boot | Java 8 | Kotlin | Maven | RabbitMQ | ActiveMQ | Spring Integration | Spring Cloud | Camunda | MongoDB | CosmosDB | Angular | JavaScript | Selenium | Jenkins | Docker

Fednot

Java Developer

11/2017 - 05/2018

Fednot supports notaries and their offices with legal advice, management, IT-solutions and training.

I was part of the team which designed and developed the interactive sales platform Biddit. The platform would digitize public sales of properties by notaries. This project faced some challenges in real-time handling and visualization of the respective participants in the public sale on the one hand, and the robust handling of events of both the platform and it's partners on the other.

Our team both designed the architecture and implemented the backend and frontend features, but my focus was mostly on the backend. The platform consisted of several microservices, all java 8 , spring boot applications communicating with each other through queuing and exposing rest api's for the frontend application.

Besides regular development I also gave 2 weekly demo's to stakeholders, planned meetings with annalists to further refine and discuss features, guided on-site customer testing sessions with notaries, wrote scripts to prepare test-environments with data sets, managed DTAP environments (GCP + kubernetes), handled critical issues and bug reports. Needless to say my role more than exceeded "only developing feature".

Tasks

- Full-stack development of features
- Infrastructure management in GCP and K8S
- On-site demo's and training for users

Skills

Microservices | Java 8 | Spring Boot | RabbitMQ | Event Sourcing | MongoDB | Kubernetes | Docker | Angular | JavaScript | GitLab | GitLab CI | GCP

Education

Thomas More De Nayer Sint Katelijne Waver - Electronics-ICT

Bachelor

09/2014 - 06/2017
